

# NIFTY 50 Dashboard

## What I Did Today - in plain words

Date: 2026-06-25

---

Today I made the dashboard easier to trust and easier to read. In short, four things:

- 1) Added a big LIVE FORECAST at the very top - what the model expects for the next few trading days, each with a confidence number.
- 2) Fixed the predictions table so the green tick / red cross now clearly matches the prediction next to it. The table now shows BOTH calls: Direction (up/down/flat) and Volatility (calm/stormy).
- 3) Filled the Monthly 'Market behaviour' column that was showing blanks.
- 4) Fixed the Market chart that looked uneven - it now shows clean, evenly-spaced candles.

Everything is still honest: the models are tested on data they never saw, checked for leakage and over-fitting, and the report below uses the exact numbers that are live on the screen.

# 1. New: a Live Forecast at the top

When you open the dashboard you now see a row of cards at the very top. Each card is one step into the future (1 day ahead, 2 days, 3, 5, 7, 10). For each one the model gives two calls and how confident it is.

## What the two calls mean

- DIRECTION: will the market go up (BULLISH), down (BEARISH) or stay flat (SIDEWAYS).
- VOLATILITY: will the moves be small/quiet (CALM) or big/choppy (VOLATILE).

Honest truth shown on the screen: predicting DIRECTION is very hard (about 35% right - close to a coin toss), so it is greyed out and marked LOW-trust. Predicting VOLATILITY is the model's real strength (about 55-68% right). So trust the volatility call.

## Today's forecast (as of 2026-06-19, NIFTY 23961)

| Lead | Date       | Direction (conf) | Trust | Volatility (conf) |
|------|------------|------------------|-------|-------------------|
| +1d  | 2026-06-22 | SIDEWAYS (42%)   | LOW   | CALM (55%)        |
| +2d  | 2026-06-23 | SIDEWAYS (38%)   | LOW   | CALM (55%)        |
| +3d  | 2026-06-24 | SIDEWAYS (37%)   | LOW   | CALM (57%)        |
| +5d  | 2026-06-26 | BULLISH (37%)    | LOW   | VOLATILE (52%)    |
| +7d  | 2026-06-30 | BULLISH (40%)    | LOW   | VOLATILE (55%)    |
| +10d | 2026-07-03 | BULLISH (36%)    | LOW   | VOLATILE (55%)    |

Read it like this: 'Over the next 5 trading days the model leans bullish but with low trust, and expects volatile moves with ~52% confidence.' Use the volatility call for risk; treat direction as a weak hint.

## 2. Fixed the predictions table (the tick now makes sense)

You spotted that some rows had a green tick even though the prediction looked wrong. You were right to question it - here is what was happening.

### The problem

The column was labelled 'Prediction' but it was showing the DIRECTION (bullish/bearish), while the tick was secretly scoring the VOLATILITY call. So a row could say 'BULLISH' with a green tick because the volatility was right - confusing.

### The fix - now the table shows BOTH, side by side

- DIRECTION group: predicted up/down/flat, what actually happened, and its own tick.
- VOLATILITY group: predicted calm/stormy, what actually happened, and its own tick.

Now each tick sits right next to the thing it scores, with a line between the two groups so they can't be mixed up.

### The honest scoreboard (last 50 predictions per timeframe)

| Timeframe       | Direction hit     | Volatility hit  |
|-----------------|-------------------|-----------------|
| Intraday 5-min  | 34% (near random) | 77% (real edge) |
| Intraday 15-min | 40% (near random) | 76% (real edge) |
| Weekly          | 28% (near random) | 58% (real edge) |
| Monthly         | 32% (near random) | 74% (real edge) |

This is the key takeaway: nobody can reliably call daily direction (it is ~33% by luck with 3 choices). The model's edge is in spotting calm vs volatile markets.

## 3 & 4. Two clean-ups

---

### 3. Monthly 'Market behaviour' was blank - now filled

The last 21 monthly rows showed a blank for what the market actually did. Reason: that column needs to look 21 days into the future, and the test data stopped before that. The actual prices DO exist in the full price history, so I now read the real outcome from there. Result: 0 blanks - every row shows bullish / bearish / sideways.

### 4. The Market chart looked uneven - now regular

The chart was drawing a few hundred points spread across 10 years, so candles had big gaps and a huge price range and looked messy. I switched it to the last 120 back-to-back candles, so the chart is even and clean for intraday, weekly and monthly.

### A note on freshness (kept honest)

The forecast is dated 19-Jun-2026 because that is the last day in the raw 1-minute data. To move it forward, the data file just needs newer days, then two scripts re-run and the forecast advances by itself. Nothing is faked to a later date.

## In one minute

---

|                        |                                                              |
|------------------------|--------------------------------------------------------------|
| <b>Top of screen:</b>  | Live forecast for the next 1-10 days, with confidence.       |
| <b>Table:</b>          | Shows BOTH direction and volatility, each with its own tick. |
| <b>Trust:</b>          | Volatility call (~55-77%). Direction is weak (~35%).         |
| <b>Monthly column:</b> | No more blanks - shows the real outcome.                     |
| <b>Market chart:</b>   | Even, clean candles (last 120, back-to-back).                |
| <b>As of:</b>          | 19-Jun-2026, NIFTY 23961 (latest data).                      |
